## ***3. Description***

BC CAHS is looking to digitalize their sample registration process. Currently, BC CAHS accepts all sample submissions through a physical form (Figure 1). This form is then manually transposed into an excel sheet, which houses all information about the submitted sample and lab results. BC CAHS aims to replace this excel based system with a database that can be filtered, effectively searched through and edited. Through-out this term, our team's focus will be on designing a centralized database that can be used by BC CAHS lab workers. Our emphasis will

be on implementing this database, and a front-end component which allows CAHS staff to filter, search and edit existing database elements.

**BC CAHS Sample Submission Form**

All fields should be completed if the information is to be included on the final report.  
Analyses marked with \*\* indicate an ISO/IEC 17025:2017 accredited assay.

Figure 1: Current Sample Submission Form

#### 4. Proposed Solution

The CAHS team has asked us to digitize and optimize their current sample registration and tracking processes. After preliminary discussions about their needs, our team proposes to implement a relational database hosted on their internal servers for quick and reliable data access, updating, and querying. We also plan to build a simple frontend for their team to interact and input their required form data to send to the database.

Our proposed solution will have a fully implemented relational database connected to a simple frontend for the CAHS team to input data. Our system will also allow the team to do some simple queries to search and filter current/past records.

#### 5. Stakeholders

- Ahmed Siah - [ahmed.siah@cahs-bc.ca](mailto:ahmed.siah@cahs-bc.ca)
  - Director - The head of the CAHS team
- Shelby Reimer - [shelby.reimer@cahs-bc.ca](mailto:shelby.reimer@cahs-bc.ca)
  - Research Assistant - Our main point of contact as she has direct experience with the current system in place

## 6. *Proposed Technology*

**Frontend:** ReactJS

**Backend:** Express

**Database:** PostgreSQL

**Servers/Hosting:** Canada Compute Arbutus

## 7. *Assumptions*

### 7.1. *Non-Technical Assumptions*

- The submission form information will be manually inputted.
- The application should not be publicly accessed, it is for internal usage only.
- The information should be confidential and only visible to employees.

### 7.2. *Technical Assumptions*

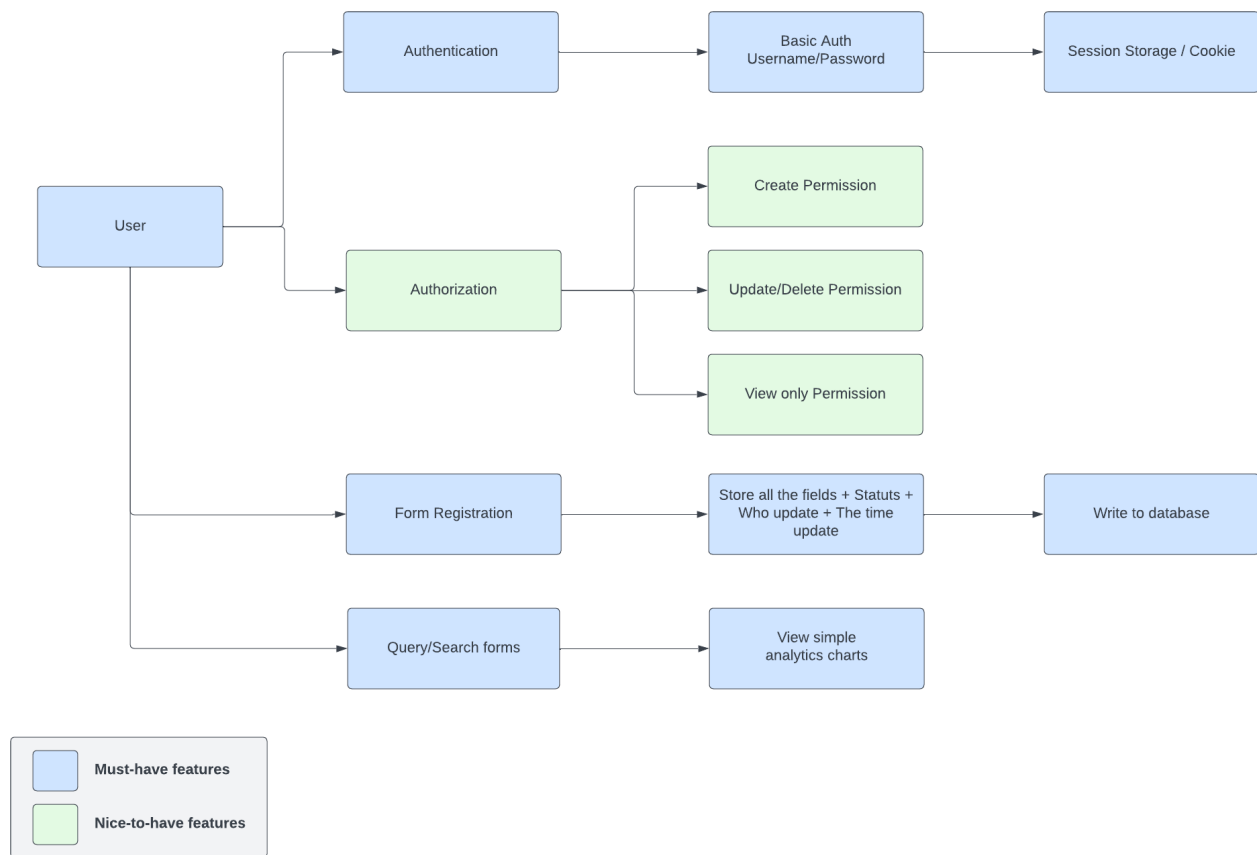

- The application will be developed from scratch.
- There is no server provided at the start, all database servers will be hosted at a local machine for each individual developer.

## 8. *Deliverables*

Deliverable	Description
Code	A zip file of all the source code or github repository that owned by the stakeholder
Documentation	A concise documentation that states the high level information of how the system work

## 9. *Requirements*

- After receiving a submission form from their client, the client wants to be able to fill in all the information related to the submission form including all the fields, status, as well as the timestamp of each event.
- The entered form entries can be updated (field values or status), including who updated the status, and the updated timestamp should be stored as well.
- Client also requests a basic dashboard that shows all the entered form submissions, and the ability to filter/search for a specific form for analytics purposes.
- On the dashboard screen, it should show some basic analytical numbers like: number of forms that are at a specific status, or how many form submissions that have not yet been processed for a while.

## 10. Lower Priority Features

- Implement detailed graphical representation of data, as this may not fall within the scope of this project term.
- Deploy the application Compute Canada Arbutus (internal servers).

## 11. Out of Scope

The CAHS team would eventually like to implement a mobile version of the program as well as move everything into a cloud-based architecture to make everything easily accessible to all staff currently working in the research lab.

They would also like a dashboard reporting with in-depth visualizations. However, our team may not get to those features and may be a nice-to-have if possible.

## 12. Existing System

The current sample submission form uses a method in which CAHS receives documents written by clients and enters them directly into a spreadsheet. All information from the submission form gets manually entered into the spreadsheet. And the separate spreadsheet where diagnostic status details are inputted (including dates and initials of staff).

#### 14. High-Level Schedule

In the 12 weeks, the BCIT team will spend the time to research, plan, design a prototype, and finally implement the software. Each week the BCIT team will update the CAHS team on their current progress and what will be next on the BCIT team's agenda.

A weekly meeting is scheduled every Friday at 1:00pm to discuss in detail any updates from the BCIT team as well as further requests from the CAHS team.

#### 15. High-Level Work Breakdown Structure (WBS)

Owner	Description	Completion Date
BCIT Team	Research serverless database systems Design the high-level architecture prototype	Sept 30th, 2022
BCIT Team	Design UI/UX	October 31st, 2022

BCIT Team	Develop the technical requirement including Frontend and Backend	November 30th, 2022
BCIT Team	Testing and demo	December 2nd, 2022

## ***16. Ethical Impact***

The BC CAHS strives to provide unbiased, third party information for the public, regulators and stakeholders to make informed decisions regarding key issues relating to aquatic health. As developers, we will be handling potentially sensitive client data. We must ensure that this data is secure and confidential. Furthermore, our product will be trusted to be functional, and accurate to ensure that the work of BC CAHS maintains its integrity.
